

## **Satake Australia Pty Ltd**

Satake Australia Pty. Ltd. is a global leader in cereal, pulse and nut processing technology. A part of the Satake Corporation of Japan, through its predecessors Henry Simon and Thomas Robinson, Satake's history in Australia goes back over a hundred years. The Corporation develops today through providing 'Innovative Solutions'.

Many of Australia and New Zealand's largest feed mills have been built by Satake, an area where the company continues to grow and develop new technologies. The company provides smaller and modular mills too for mash or pellets. In the field of wheat milling, Satake's PeriTec Debranning System, new Rollermills, Purifiers and Food Quality InterLock Sieves set the standards.

The company's colour sorting processes continue to grow in the cereals sector. The latest machines with 30 – 35 tonnes per hour capacity are now being used by bulk processors and grain handlers. Millers appreciate the 'super clean' wheat stream that colour sorters provide with minimal power and floor space requirements.

Satake is also active in areas such as pulse dehulling, barley debranning and rice milling. Turnkey solutions are provided for complete process plants engineered and in many cases manufactured by the company in Sydney.
